TECHNICAL SPECIFICATIONS

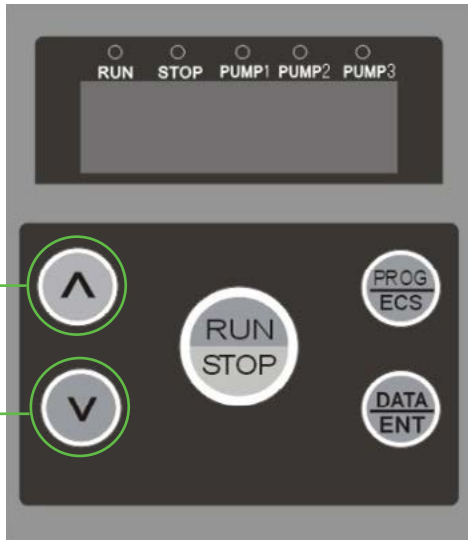
ITEM		SPECIFICATIONS
Control Model		SPWM
Input		220V: 220±15%; 380V: 380±15%; 525V: 525±15%
Output Voltage		0~input voltage
5-Digit Display & Status Indicator light		This shows frequency, current, speed, voltage, set pressure, current pressure, fault and so on
Communication Control		RS-485
Operating Temperature		-10~40°C
Ambient Humidity		0-95% relative humidity (non-condensing)
Vibration		<0.5G
Frequency Control	Range	0.10~400.0Hz
	Setting Resolution	Digital: 0.1Hz; Analogue: 1% maximum frequency
	Output Resolution	0.1Hz
	Keyboard Setting Mode	Set by up/down keys
	Analogue Setting Mode	External voltage 4-20mA, 2-10V
	Other Functions	Frequency limits, running frequency, frequency stop, three adjustable carrier frequencies can be set separately
Protection Function	Overload	Electronic relay protection motor drive (for constant torque 150%/1min)
	Low Voltage	220V: DC Voltage<200V; 380V: DC Voltage<350V; 525V: DC Voltage<472V
	High Voltage	220V: DC Voltage>242V; 380V: DC Voltage>420V; 525V: DC Voltage >578V
	Instant Stop and Restart	Restarted by frequency track after instantaneous stop
	Stall Prevention	Anti-stall during acceleration/deceleration run
	Output short circuit	Electronic circuit protection
	Other functions	Fin over-heating protection, restriction of reverse running, direct start after power on, fault reset, parameter lock PID, one-drive-more, etc.

FUNCTIONING
OPERATOR PANEL

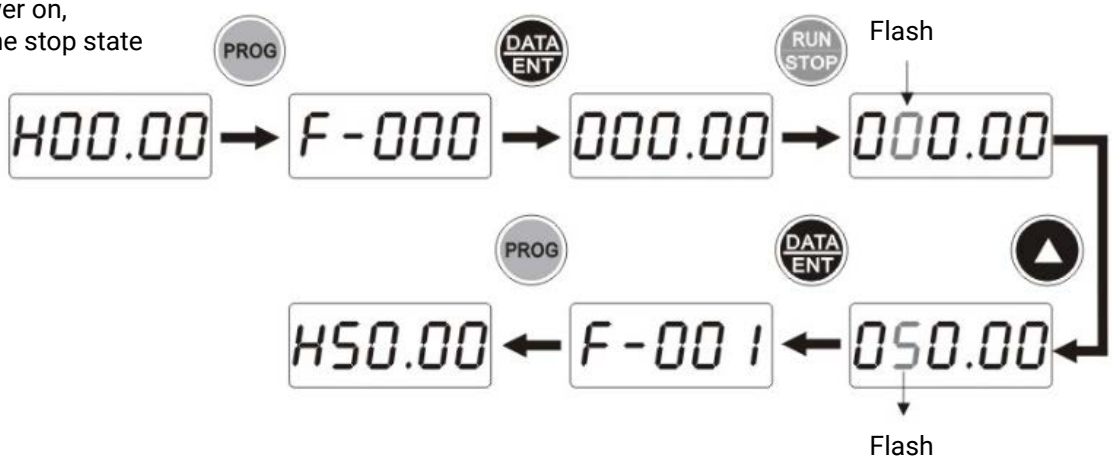
Press the RUN/STOP button

- If the RUN and STOP buttons flash at the same time, the VSD is in its stop state
- If the PUMP1 indicator is on and the RUN button flashes, this is automatic state
- If the STOP indicator flashes, the VSD is in maual mode

Use the up and down arrows to adjust the frequency.



Power on,
at the stop state



BASIC ADJUSTMENT

SINGLE PUMP

1. Confirm the rated parameter of the pump motor:
   F002=rated frequency (factory setting=50HZ)
   F003=rated voltage (factory setting=380V/220V/525V)
   F007=rated current (factory setting=controller's rated current)

2. Confirm the maximum pressure range of the pressure transmitter:
   10 bar - F006=10
   16 bar - F006=16
   25 bar - F006=25

3. Check the motor direction of rotation:
   Press STOP/RUN to choose the Debug (manual) mode - the DEBUG indicator will be on.
   Press "∨" or "∧" to change the pump's speed, and check and change the direction of rotation.

MULTI-PUMPS

1. Establishment of pump stations:
   F011 = A B
   B= current pump station/pump number (eg. Pump1 = 1)
   A= total number of pump stations (eg. 2 pumps in system = 2)
   Note: this must be set on each pump

2. On the master controller, confirm the parameters of the pump and rated pressure range of pressure transmitter:
   F002/003/006/007 - As section 1 for a single pump

3. Check each pump's direction of rotation:
   Press the STOP button of the master controller to choose the DEBUG mode
   (manual) - the DEBUG indicator will be on
   Press each pump's "∨" or "∧" buttons to change the pump's speed, and check and change the direction of rotation.

AUTO RUN

1. Single pumps run automatically.
   Press STOP/RUN to choose the auto mode - AUTO indicator will be on.

2. Multi-pumps run automatically
   Press the STOP button on the master controller to choose the auto mode -
   AUTO indicator will be on.

PARAMETERS & FUNCTIONS

F2053

CODE	FUNCTION	DETAILS	FACTORY SETTING

FAULT FINDING

F2053

FAULT FINDING FOR CONTROLLER

Fault Display	Fault Contents & Description	Disposal methods
E04.D	Over-current during ramp-up	●Check whether the motor has got short circuit or partial short circuit and whether the insulation of output wire is good. ● Extend the ramp-up and Ramp-down time. ●The configuration of the inverter is not reasonable. The inverter's capacity should be increased. ●Check the motor for damage. ●The inverter has failure. Please send it to the factory for repair.
E04.P/E24P	Over-current at constant speed	
E04.B/E24B	Over-current at decel	
E02. H/D	Over-current at stop	
E02. P/B E01.H/D	Over-voltage	●Extend the Ramp-down Time or add a braking resistor. ●Improve the mains supply voltage and check. whether there is any sudden change in the voltage.
E01.P/B E0H. H/D	Low voltage	●Check whether the input voltage is normal. ●Check whether there is sudden change in load. ●Check whether there is any phase missing.
E0H. P/B E07.D	Overheat of inverter	●Check whether the fan is blocked . ●Check whether the ambient temperature is normal.
E07.P E07.B E08.D	Inverter overload 150% Per minute	●Check whether the capacity of the inverter is lower. ●Check whether there is any jamming in the mechanical load. ●The setting of V/F curve is bad. Set it again.
E08.P E08.B E0F	Motor overload 150% Per minute	●The equipped motor is too small. ●The motor is hot and the insulation becomes bad. ●Check whether there is any phase missing. ●The mechanical load is increased.
E0F	Parameter setting error	●Parameter reset
E.1P	Alarm of PID break detection	The standard of the feedback pressure. The set range from 0-100%When the feedback pressure is under the value of F027, even later than the time of F028, it will alarm as 'E1P'. Please check the water inlet, connection of pressure sensor, the rotation of pump motor, if there' s some air in the pump.Note: If F027/028=0, the alarm will be invalid.
E.2.P	Alarm of lack of water	●Check the inlet if it is normal
E.H.P	Alarm of high pressure	● Check the feedback pressure if is higher than high pressure protect value
E.L.P	Alarm of low pressure	● Check the feedback pressure if is lower than low pressure protect value
E.L.B	Alarm of low water level/non-negative pressure	● Check the inlet if it is normal ● Check the motor rotation if it is normal
E5P	Alarm of under pressure	● Check the pipe pressure if it is normal
E3P	Low water level	● Check the inlet water level if it is normal
E11	Time limit	● Contact the factory or the distributor.

Fault Codes:

E XX Y

- Y — Status
  - H: At stop
  - D: At acceleration
  - P: At constant speed run
  - B: At deceleration
- XX — Alarm messages
- E — Fault

FAULT FINDING FOR WATER SUPPLY CONTROLLER

E.1.P: Warning for PID break detection

Parameter: F027 - The standard of the feedback pressure (set range: 0-100%).
When the feedback is under the value of F027 for longer than the time of F028, the E1P warning will appear.
Please check the water inlet, connection of the pressure sensor, the rotation of the pump motor and if any air is present in the pump.
Note: If F028=0, the warning will be invalid.

E.2.P: Warning for lack of water

Parameter: F038 - the water detection delay.
When the external terminal detects the lack of water and the time of F038 elapses, the E29 warning will be released. The code for the external terminal is 31.
Note: If F038=0, the protection function is invalid.

E.H.P High pressure warning

E.L.P: Low pressure warning

Parameter: F039 - The protection point of high pressure (0-100%).
F040 - The protection point of low pressure (0-100%).
The delay of water out protection of high pressure and recovery.
When the pressure is higher than F039 and keeps within the time of F041, warning EHP will be released.
When the pressure is lower than F040 and keeps within the time of F041, warning ELP will be released.
The normal working pressure is between F039 and F040. If it exceeds the time of F041 the alarm will automatically be released.
Note: If F041=0, the protection of high/low pressure is invalid.

E.L.B: Warning of low water level/negative pressure

Parameter: F042 - The delay of low water level/negative pressure detection warning.
Parameter: F043 - The delay of low water level/negative pressure recovery
When the external terminal (S3) detects the low water level/negative pressure signal, it delays the ELB warning for the time of F042.
When the external terminal (S3) detects the normal signal, it auto releases the alarm after delaying the time of F043.
Note: if F042=0, the alarm function is invalid.

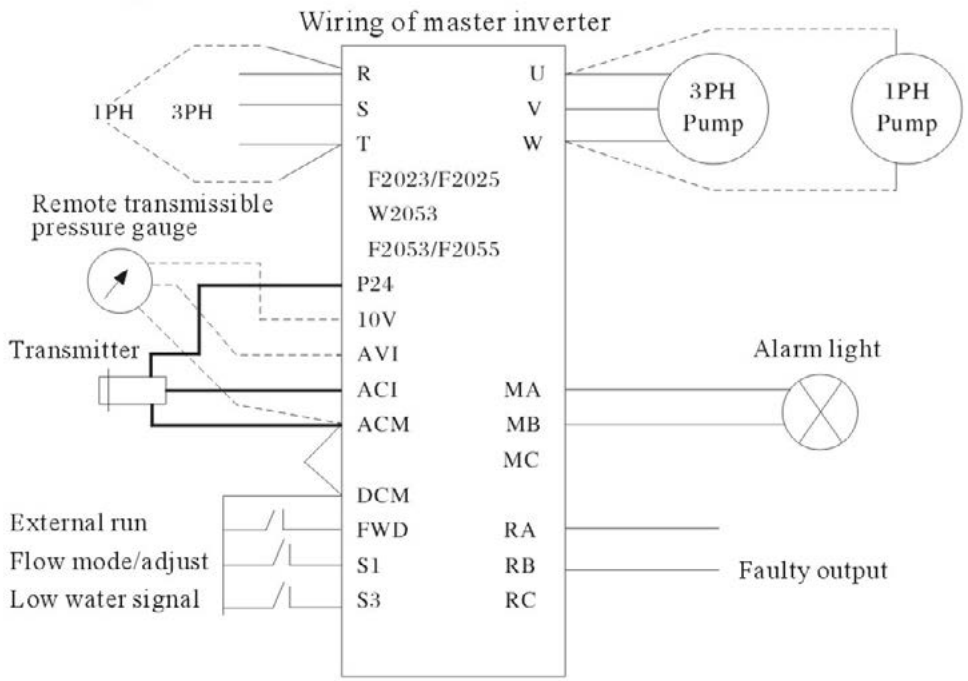
FUALT FINDING

F3053

CODE	FUNCTION	CORRECTION
E.2.P	External lack of water protection	Check that the water probe is functioning. Ensure that connection and terminal is normal. Check that parameter is correct.
E.3.P	Internal lack of water protection (function begins at 1507)	Press the 'stop' button to reset
EE.01P	System electric power is insufficient (function begins at 1507)	Check if power voltage is low Check if wire size is too small Check if power supply is insufficient
EE1P	Spare pressure transmitter faulty (function begins at 1507)	Replace transmitter if it is broken. Corrrect wiring of transmitter if incorrect. Tighten loose wiring. Confirm that communication between pumps is normal.
E.11	Working time limit	Time limit after running 1hour. Check with technician for details.
E.H.B	Alarm of high water level (function begins at 1507)	Check if high water level detector is normal. Confirm that wiring and terminal are correct. Check if parameters are correct.
E.L.B	Alarm of low water level	Check if low water level detector is normal. Confirm that wiring and terminal are correct. Check if parameters are correct. Confirm that inlet is fine. Check motor rotation.
EE21	Detect no pressure transmitter signal (function begins at 1507)	Check transitter's wiring.
E.L.P	Alarm of low pressure	Check if feedback pressure is lower than low pressure protection value.
E.H.P	Alarm of high pressure	Check if feedback pressure is higher than high pressure protection value.
E5P	Alarm of under pressure	Check if pipe pressure is normal.
EEPn	Alarm of broken pump	Check the water pumps.
E.1P	Alarm of PID break detection	The standard of the feedback pressure. The set range from 0-100% when the feedback pressure is under the value of F027, even later than the time of F028, it will show as 'E.1P'. Please check the water inlet, connection of pressure transmitter, the rotation of pump motor and if there is air in the pump. Note: If F027/028=0, the alarm will be invalid.
E04.D/E24.D	Over-current during ramp-up	Check whether the motor has experienced a short circuit or partial short circuit and whether the insulation of output wire is good. Extend the ramp-up and ramp-down time. The configuration of the inverter is not reasonable. The inverter's capacity should be increased. Check for motor damage. Alternatively, the inverter has failed. Please send it to the factory for repair.
E04.P/E24P	Over-current at constant speed	
E04.B/E24B	Over-current at deceleration	
E04.H	Over-current at stop	
E02.H/D E02.P/B	Over voltage	Extend the ramp-down time or add a breaking resistor. Improve the main supply voltage and check whether there is any sudden change in the voltage.
E01.H/D E01.P/B	Low voltage	Check if the input voltage is normal. Check if there is sudden change in load. Check if there is a missing phase.
E0H.H/D E0H.P/B	Overheating of inverter	Check if the fan is blocked. Check if the ambient temperature is normal.
E07.D E07.P E07.B	Inverter overload 150% per minute	Check if the capacity of the controller is lower. Check if there is any jamming in the mechanical load. Reset the V/F curve.
E08.D E08.P E08.B	Motor overload 150% per minute	The equipped motor is too small. The motor is hot and the insulation poor. Check if there is any missing phase. The mechanical load has increased.
E0F	Parameter setting error	
E5P	Alarm of under pressure	Check if the pipe pressure is normal.

WIRING



SWITCH DESCRIPTION ON MAIN BOARD:

SW1: 

V: 0-10V voltage signal
I: 4-20mA current signal

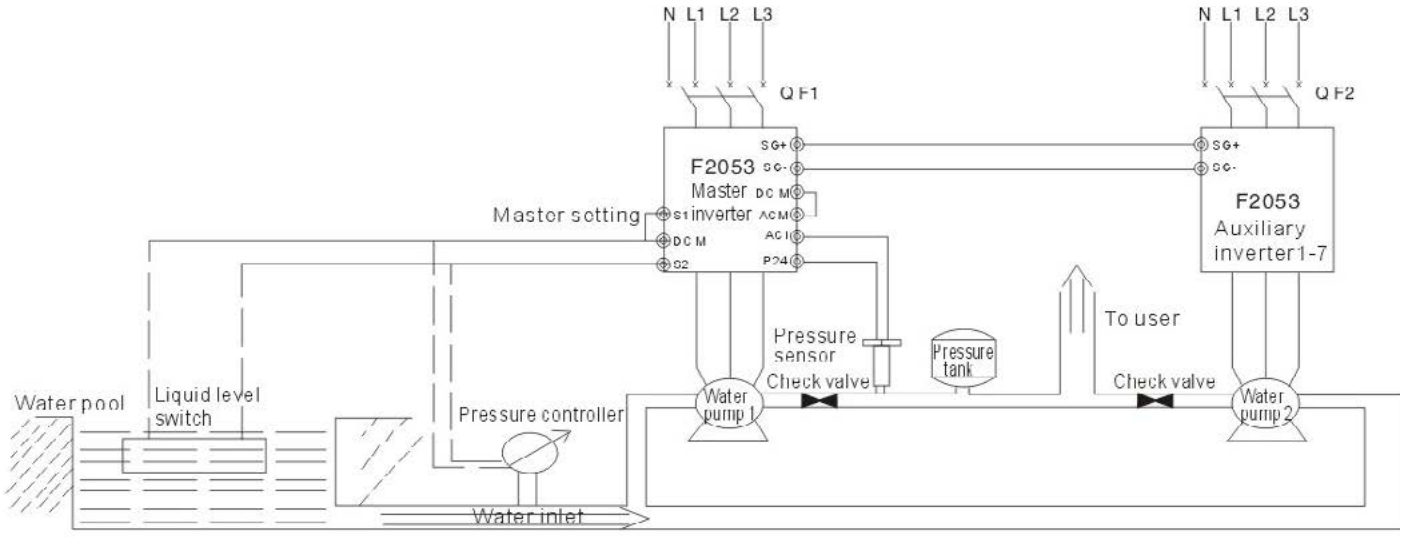
SW2: 

AVI: remote transmissible pressure gauge 0-10V

SW3: 

Input polarity optional switch
PNP: Multi-function input terminal (S1-S4), FWD/REV connect to common terminal DCM
NPN: Multi-function input terminal (S1-S4), FWD/REV connect to common terminal EV

WORKING SYSTEM



OPERATOR PANEL

The digital keypad includes two parts: the display panel and keypad. The display panel displays the parameters and shows the operation status of the AC drive and the keypad provides a programming and control interface.

Button	Name	Parameter step 1	Parameter step 2
PROG	Programming	Enter or quit from parameter setting	
DATA	Confirm	Parameter no. confirm	Parameter value confirm
∧	Increase	Parameter no. increase	Parameter value increase
∨	Decrease	Parameter no. decrease	Parameter value decrease
RUN/STOP	RUN/STOP	Shift parameter no	Parameter value shift
Button	**Name**	**Pressure mode**	**Water flow mode(adjust)**
PROG	Programming	Enter or quit from parameter setting	
DATA	Confirm	Displayed Content	
∧	Increase	Increase of set pressure	Increase of set flow
∨	Decrease	Decrease of set pressure	Decrease of set flow
RUN/STOP	RUN/STOP	RUN/STOP	

PRESSURE TRANSDUCER

MODEL SELECTION

		SYSTEM PARAMETERS		
		0-10Bar	10-16Bar	16-25Bar
RECOMMENDED MODEL	10Bar	X		
	16Bar		X	
	25Bar			X

SPECIFICATIONS

Accuracy:	0.5%FS; 1%FS
Nonlinearity:	Full span x 0.2%
Repeatability:	Full span x .05%
Output:	4-20mA (two wire), 0-5V, 0-10V (three wire); 2mV/V, 3.3mV/V (PTS-210)
Input voltage:	24(12~36)VDC (Amplifying signal), 10(6~12)VDC (mV output)
Operating temperature:	-40~800C
Compensated temperature:	0~700C
Overload pressure:	150%FS
Medium material:	Stainless steel
Electric connector:	Hirschman (DIN), M12, 4 pin, Bendix connector, grand cable (custom design)
Process connector:	G1/4, G1/2, 1/2NPT, 1/4NPT, M12*1.5 (custom design)
